

Importance of data stewardship for marine research

Greg Reed

Executive Officer, Australian Ocean Data Centre Joint Facility

Past Co-Chair, IODE Committee

*International Symposium for the Integration of marine-related Data and Information
Tokyo, Japan, 8th December 2011*

Presentation

- What is data stewardship: why do we need it
- Case study: Australian Ocean Data Network

Marine data are important

- Marine data are fundamental to understand processes that control the environment
- Marine data are a key requirement for effective strategic decision making
 - play an important role in promoting the development of economic activities
- Underpin many of our activities, such as:
 - navigation
 - sea transportation
 - fisheries
 - marine disaster mitigation
 - environmental monitoring

Marine data are unique

- Marine data are expensive to collect
- Marine data are unique and unrepeatable
 - the environment is constantly changing
- Spatial and temporal coverage is quite sparse
 - Research vessels and moorings are small dots on a map
- Important to ensure that maximum benefit derived from data
 - Share data !

“capture once – use many times”

Data Stewardship

- The *acquisition, processing, preservation, quality assurance and dissemination* of marine data are key elements of curation and archiving data
- This is known as ***Data Stewardship***
- A community approach
- Stewardship \neq ownership

Components of Data Stewardship

- Key components include
 - Preserving detailed information about observed variables
 - Details of observation instruments used
 - Techniques and calibrations
 - Comprehensive metadata
 - Creation of products derived from archived data

End-to-end data management

- End-to-end data management system handles data from the point of collection, through processing and quality control, to archival and dissemination.
- End-to-end management of data facilitates the ability to integrate data from multiple sources and sensors (i.e. satellites, *in situ*, and model data)

Elements of end-to-end data systems

1. Standardized data collection

- The lack of standardized data collection efforts can hamper long-term value of datasets
- Data collection must be standardized to allow data sets from a variety of sources to be integrated.

Elements of end-to-end data systems

2. Common vocabularies

- Use of common vocabularies is an important prerequisite towards consistency and interoperability.
- Common vocabularies consist of lists of standardized terms that cover a broad spectrum of disciplines of relevance to the oceanographic and wider community.
- Using standardised sets of terms reduces ambiguities and enables records to be interpreted by computers.

Pan-European infrastructure for Ocean & Marine Data Management

SeaDataNet

BODC web services (Libraries) CL12

Results

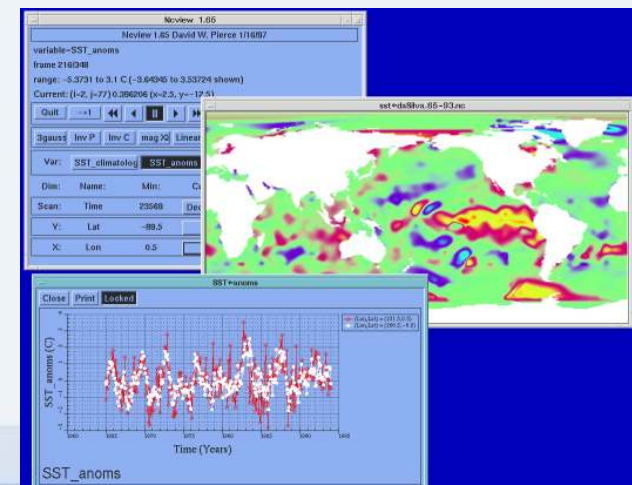

Ready for use

List key	Long name	Short name	List version	List last modified
C181	International Hydrographic Bureau (1953) sea areas	IHB Sea Areas	0	1/1/1954 12:00:00 PM
C182	Terms used for sea areas from International Hydrographic Bureau, Limits of Oceans and Seas (Special Publication No. 23), 3rd edition 1953	Sea areas	1	5/25/2018 1:00:20 AM
C183	Sea areas defined by the IHB (1953) but under SeaDataNet governance until the proposed hierarchical SeaView sea area gazetteer is available	Sea areas	1	5/25/2018 1:00:20 AM
C184	Sea areas defined by the IHB (1953) but under SeaDataNet governance until the proposed hierarchical SeaView sea area gazetteer is available	Sea areas	1	5/25/2018 1:00:20 AM
C185	Partnership for Observation of the Global Ocean ships of interest	POGO ships	20	1/14/2018 2:01:29 AM
C186	Research vessels (operated by or of interest to POGO, 1st interest is defined as active ocean-going research vessels greater than 60m in length)	SOI CSR ships	00	7/1/2018 1:00:30 AM
C187	SeaDataNet Cruise Summary Report ship metadata	SDN CSR ships	00	7/1/2018 1:00:30 AM
C188	Ship metadata (a full operating under a given name and governance type) used in SeaDataNet CSR forms including metadata in the definition to allow reliable mapping to ship hull databases	SDN CSR ships	00	7/1/2018 1:00:30 AM
C189	PLATFORM CODE	PLATFORM CODE	132	7/1/2018 1:00:30 AM
C190	SeaView salt and fresh water body gazetteer	SeaView water bodies	4	5/25/2018 1:00:20 AM
C191	Terms specified by the SeaView vocabulary governance to describe coherent regions of the hydrosphere. Includes land masses excluding freshwater bodies	SeaView water bodies	4	5/25/2018 1:00:20 AM

Elements of end-to-end data systems

3. Standard data formats

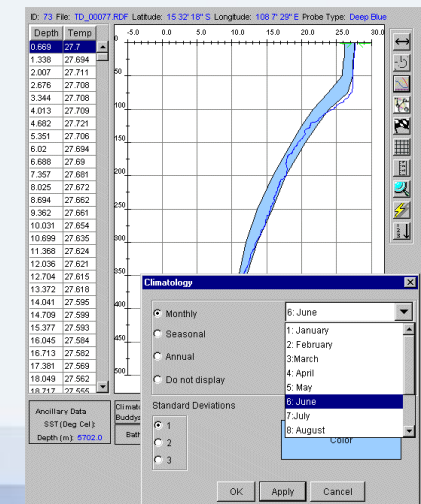

- The selection and adoption of a small number of standardized data formats is essential to ensure effective data stewardship
- The use of just a few formats can enhance the ability of data stewards to preserve information over the long term
- netCDF (network Common Data Form) is emerging as a *de facto* standard

Elements of end-to-end data systems

4. Quality assurance and quality control (QA/QC)

- Quality Assurance (QA) - procedures performed prior to instrument deployment to support the return of best possible quality data
- Quality Control (QC) - procedures/processes applied to the data returned from the instrument
- Standards for QA/QC should be well documented
- The preservation of original values, even if they appear wrong, is important for possible future re-processing

Elements of end-to-end data systems

5. Data archive

– To ensure the long-term preservation and dissemination of data, the data producers and data archives need to work together to generate the information needed to be able to understand and re-use data. This includes:

- Well-defined file naming conventions and format descriptions
- Related descriptive metadata
- Information to facilitate data dissemination

Researchers can assist . . .

- Data derived from publicly-funded research should be available for public use
- The value of data increases if aggregated into collections and are available for re-use
- Researchers can work collaboratively with the wider community to develop a data stewardship framework
- It is important that researchers receive appropriate credit for their work

Case Study.

Data Stewardship in Australia: The Australian Ocean Data Network

Australian Ocean Data Network

Setting the scene . . .

- Australia has one of the largest marine areas in the world
 - More than 8 million square kilometres
 - EEZ more than double the land area
 - >80% population lives near coast
- Tropical through temperate to sub-Antarctic

AODCJF

- Australian Ocean Data Centre Joint Facility
 - AODCJF operates as a distributed system
 - Promotes the discovery, transfer and implementation of knowledge about marine environment by facilitating the exchange and management of, and ready access to, marine data
- Established in 2005

AODCJF Partners

- Six Australian government marine agencies as initial partners
 - Australian Antarctic Division (AAD)
 - Australian Institute of Marine Science (AIMS)
 - Bureau of Meteorology (BoM)
 - CSIRO Marine & Atmospheric Research (CMAR)
 - Geoscience Australia (GA)
 - Navy Hydrography and Metoc Branch (RAN)

Australian Ocean Data Network

- The AODCJF has a shared vision of developing and delivering an Australian Ocean Data Network (AODN) to manage national ocean data resources
- The AODN provides a national infrastructure to access the distributed archives of data held in the partner institutions across Australia.
- Distributed network
 - Data will reside on agency servers
 - QC and management responsibility of agency

Publishing interoperable data

- Achievements of the AODN

- automated real-time Research Vessel Underway Data from AODCJF agencies, funded by the Australian National Data Service (ANDS)
- identifying requirements for interoperability (Marine Community Profile, CTD use case)
- facilitation and promotion of common cross-sector infrastructure in marine research

Research Vessels Aurora Australis (l) and Southern Surveyor (r); image acknowledgements: ABC Australia, CSIRO Australia

Integrated Marine Observing System

- Nation-wide collaborative program designed to observe the oceans around Australia
- Assemble and provide free, open and timely access to data that support research on
 - Role of the oceans in the climate system
 - Interaction between major boundary currents, shelf environments and ecosystems
 - Preservation of biodiversity

IMOS Integrated **Marine Observing** System

IMOS Nodes and Facilities

- 6 nodes
- 13 facilities

Data diversity in the AODN

Marine research sectors

- government, universities, private industry, not-for-profit organisations

Marine science disciplines

- Physical and chemical oceanography, biology, biogeochemistry, modelling

Marine data sources

- observation data, model output, data products

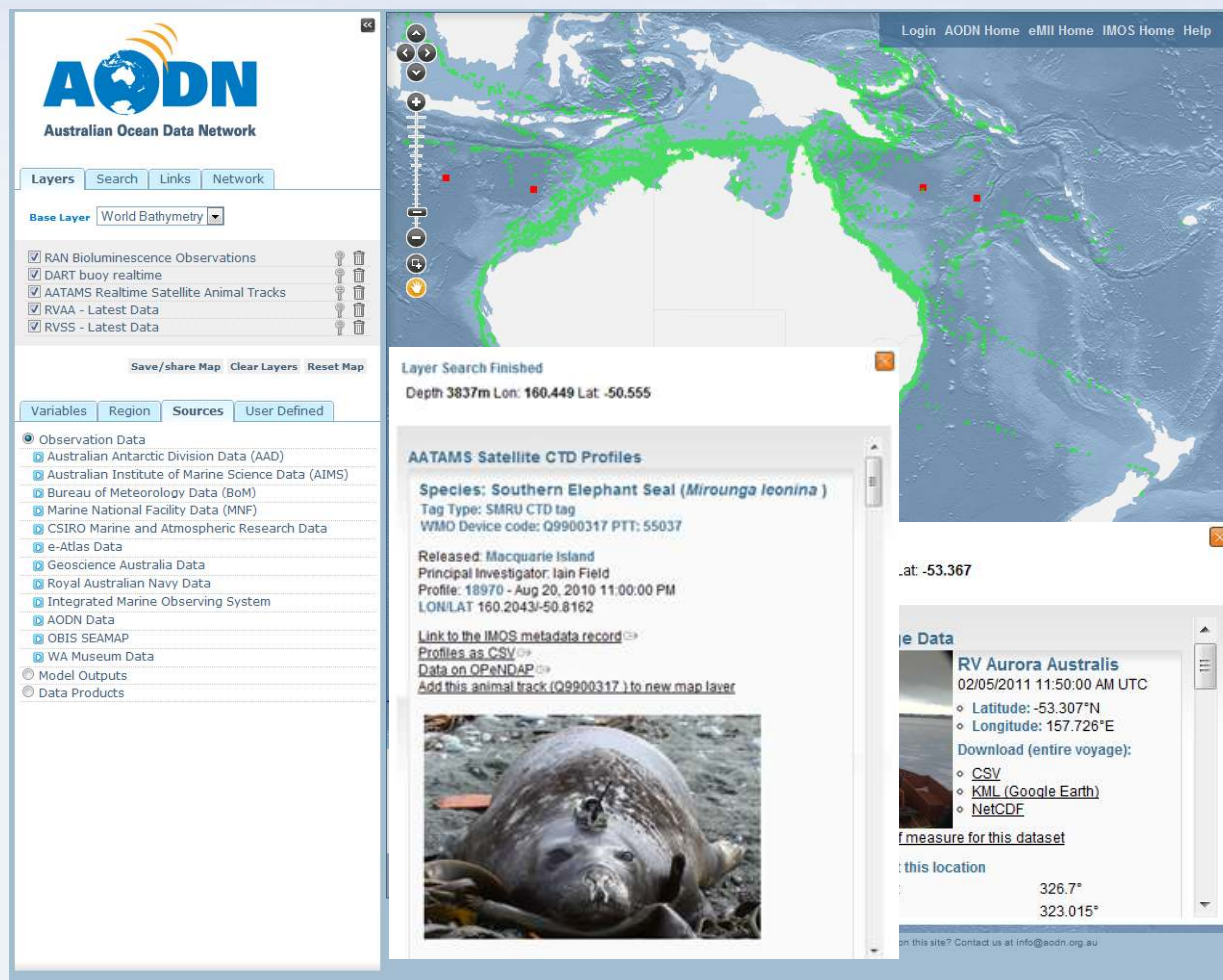

Marine data delivery

- real-time (e.g. tide gauges, tsunami buoys), delayed mode, archived / historic

Marine data formats

- gridded data (e.g. satellites, HF radar), image data, time series

Data discovery: AODN Portal

snapshot from <http://portal.aodn.org.au>

current functionality:

- map-based interface
 - zoom & pan tools
 - scale bar
 - optional overview map
 - base layers
-
- list of active layers
 - visibility options
 - time series animation
-
- list of data sources
 - drop-down menu of available layers
 - text-based search
 - relevant info & links

AODN Data Policy

- Data provided to AODN is unencumbered, i.e. it is freely accessible
- Data is documented with metadata
 - ISO 19115 standard metadata
 - Metadata hosted by participating agencies
- All data is publicly available and licenced through Creative Commons BY licence
- Result: Increase discoverability, access and re-use of marine data

Summary and Conclusions.

Summary

- Benefits of data stewardship:
 - Provision of good quality and properly archived data
 - Timely distributions of data, as well as supplementary metadata and derived product
 - Easy discovery and access to data and products
 - Elimination of major barriers to efficient use and re-use of data

Conclusion

- Data derived from publicly-funded research should be available for public use
- Every research project should have a data management component in the budget
- A framework for stewardship of research data should involve all parties ensure the needs of researchers are met
- This will ensure that the maximum benefit is derived from research data

The background is a light blue gradient with a darker blue curved shape in the top right corner and a small blue shape in the bottom left corner.

Thank you for your attention . . .
